

RDP

Objective: In this lab simulation, I created and applied a Group Policy Object (GPO) in Active Directory to enable Remote Desktop Protocol (RDP) on all domain-joined PCs. The objective was to ensure remote access capabilities by configuring the necessary RDP settings through Group Policy and verifying successful configuration across all systems.

Equipment: Ticketing System, Windows Server 2022, and (2) Windows 10 PC

Ticket: Please look at page 2

Steps: Please look at page 3

Incident Details:

Incident #. 96430

Category: RDP (Remote Desktop Protocol)

Department: Sales and Engineering

Priority: High

Assignee: Helpdesk Team

Date/Time Opened: 7/8/2025 4:05 PM

Description:

Please enable Remote Desktop Protocol (RDP) on all domain-joined PCs. Create a GPO with the appropriate settings, link it to the necessary OUs, and verify that RDP is successfully enabled on target machines.

Solution:

Incident #. 96430

Steps Taken:

1. I went into the Active Directory Users and Computers to add the OU (Organizational Unit) Workstation
2. I moved all domain-joined PCs into the Workstation OU
3. I went into Group Management Policy and created a GPO under the Workstation OU named "Enable Remote Desktop"
4. Upon making this GPO, I enabled "Allow users to connect remotely by using Remote Desktop Services" and "Require user authentication for remote connections by using Network Level Authentication"
5. Within the same GPO, I went into the folder "Restricted Groups" and added "Remote desktop users", after this I added "Engineering" and "Sales" to "this group is a member of"
6. I ran the command `gpupdate /force` through cmd to apply the changes
7. I verified connectivity to the 2 joined-domain PCs by accessing them remotely

Notes:

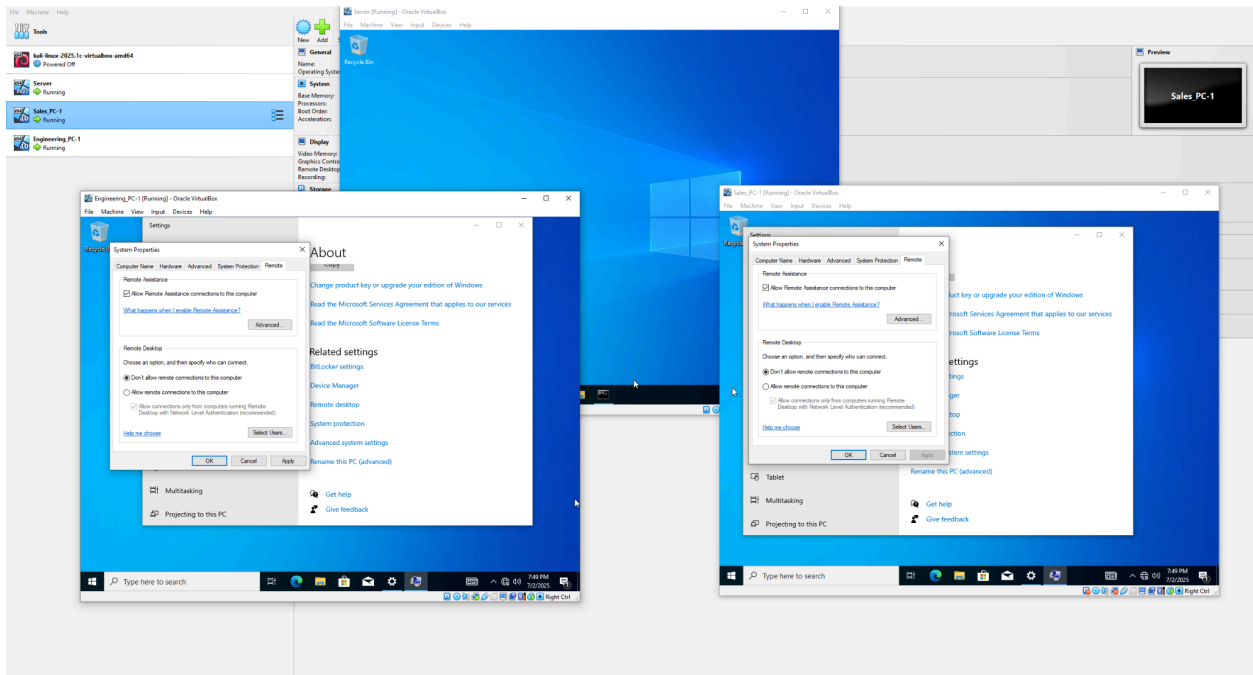

- Created OU Workstation
- Created a GPO under the Workstation OU
- Enabled "Allow users to connect remotely by using Remote Desktop Services" and "Require user authentication for remote connections by using Network Level Authentication"
- Configured Restricted Groups by adding "Remote desktop users" as the base and then added the OU "Sales" and "Engineering" as part of the group
- Verified it's working by connect to domain PCs

Time Logged: 25 minutes (4:05 PM - 4:30 PM)

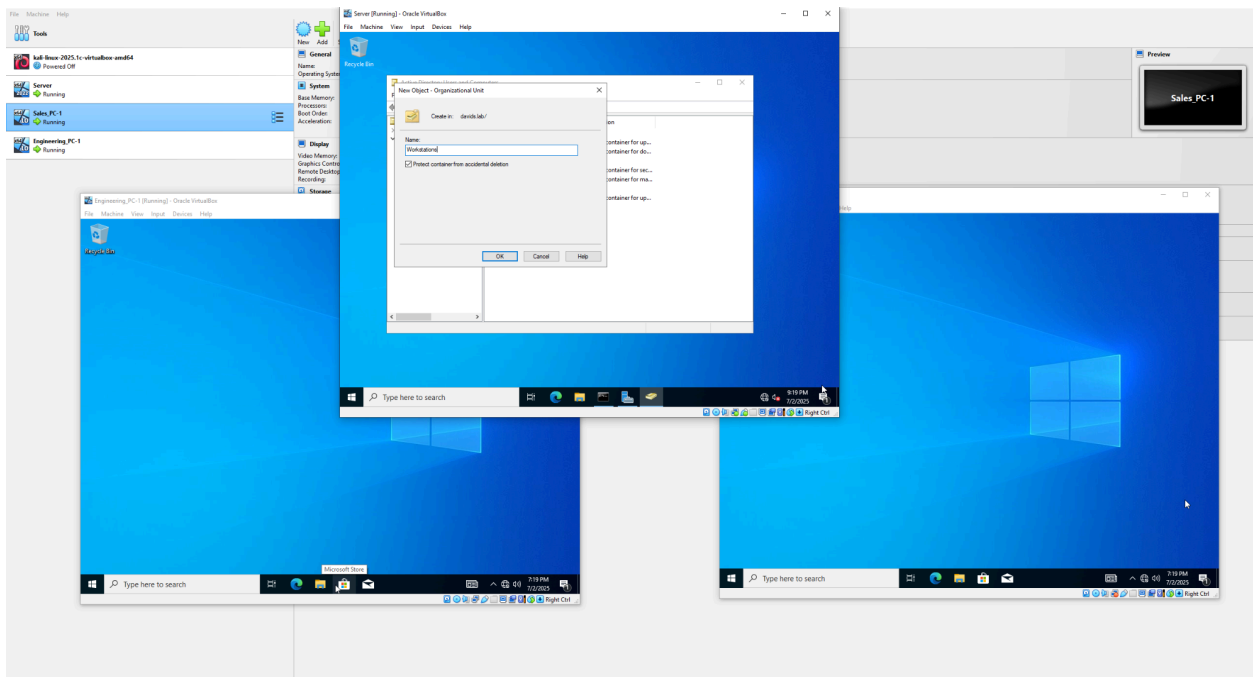

Status: Resolved and Closed

Steps

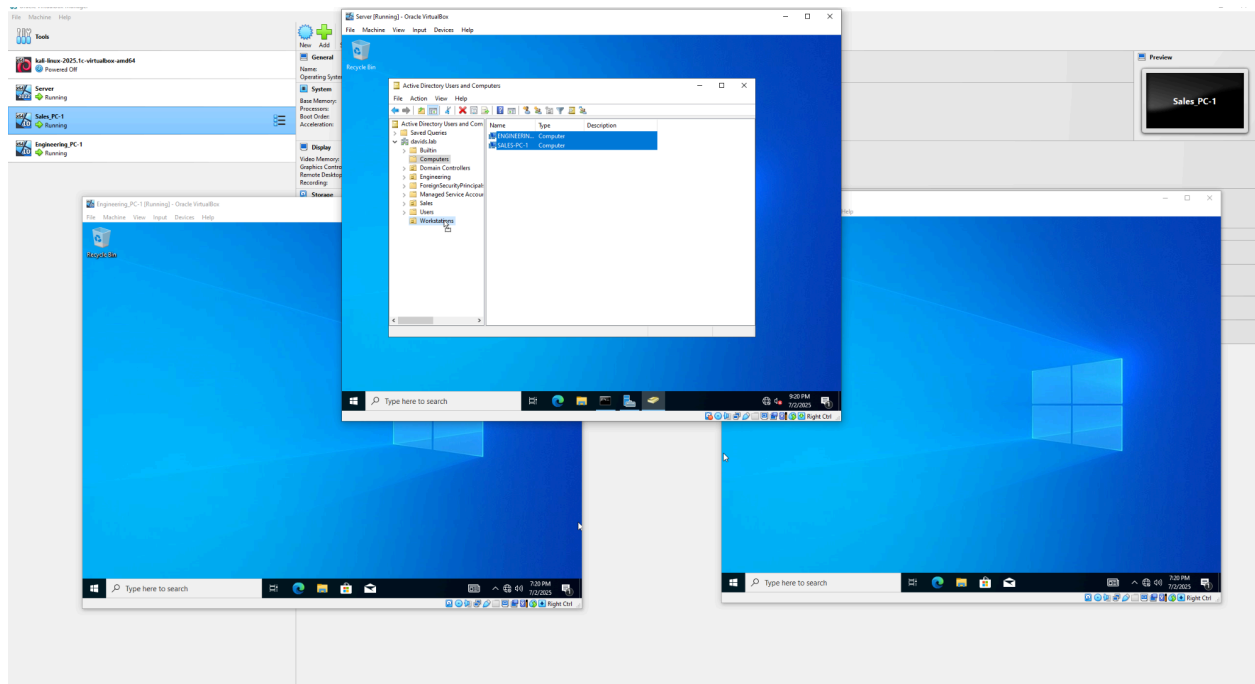

1. Check the configuration of RDP on both joined-domain PCs

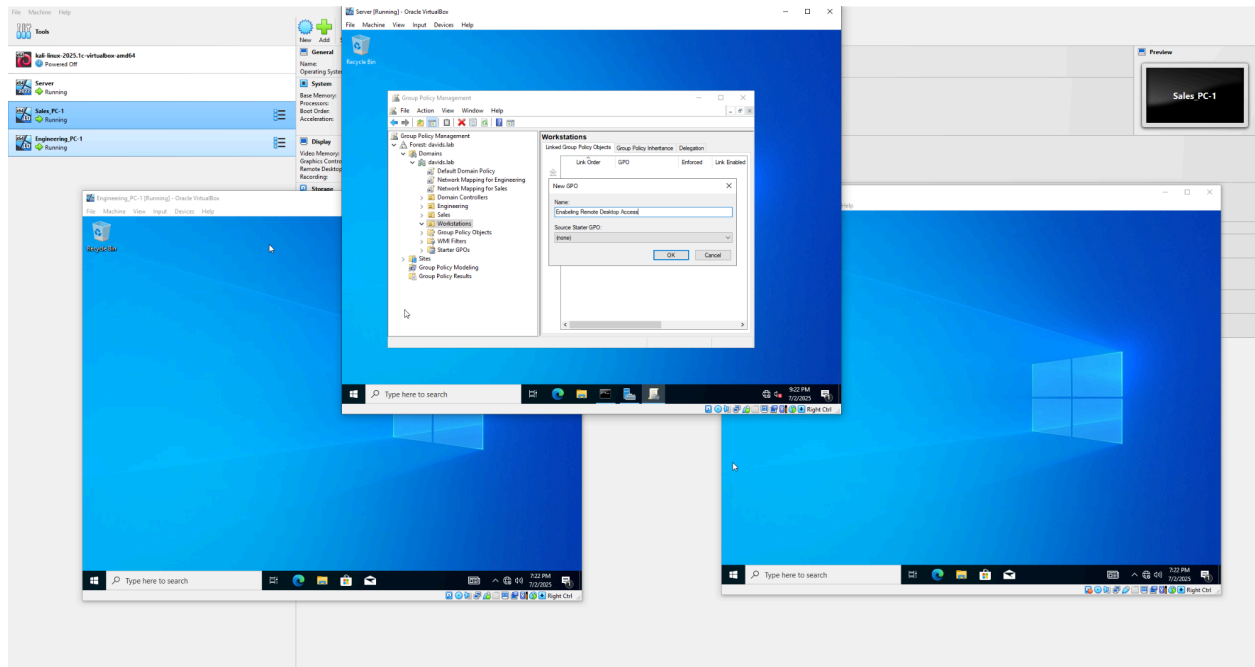

2. Create an OU (Organizational Unit) Workstation to group the joined-domain PCs

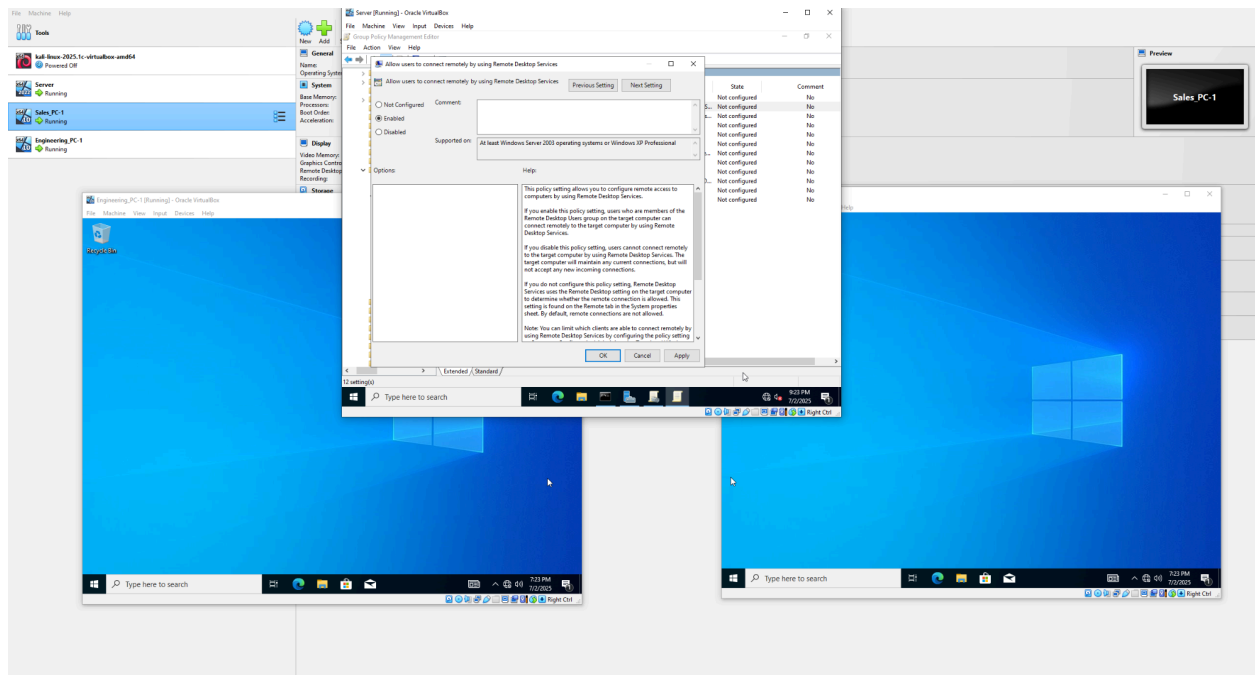

3. Drag all the domain-joined PCs into the new Workstations OU

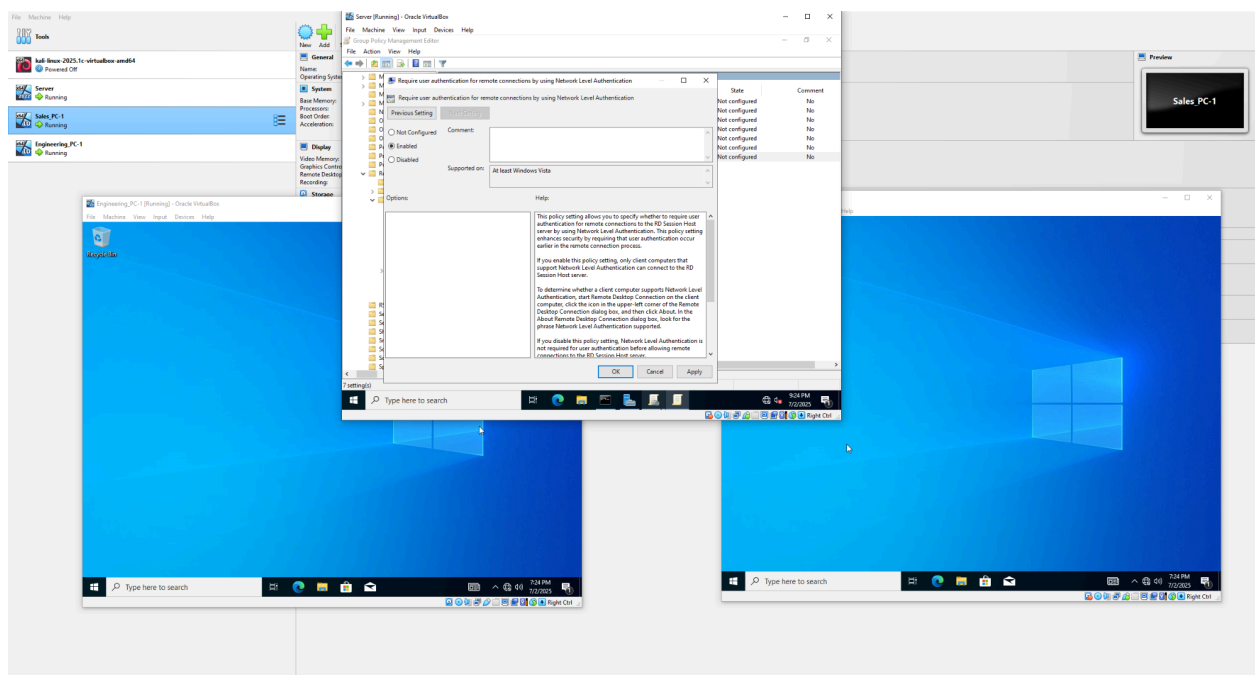

4. Create a new GPO under the Workstations OU named "Enabling Remote Desktop Access"

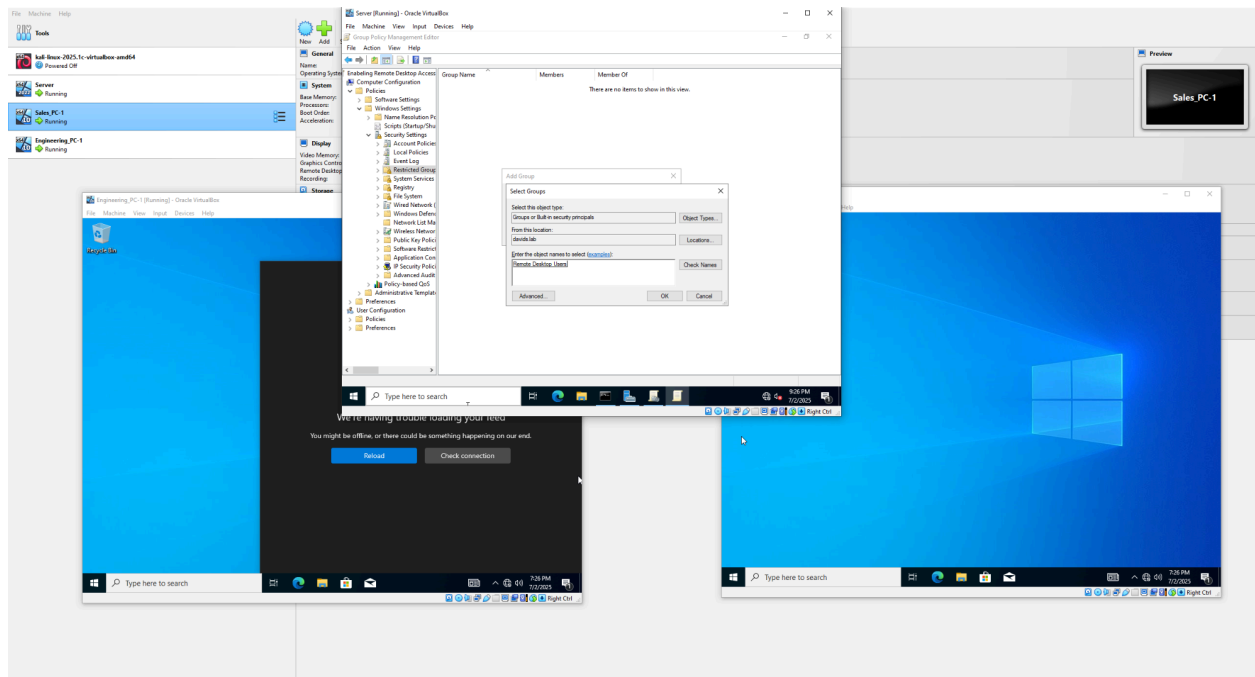

5. I edit the newly created GPO and enable “Allow users to connect remotely by using Remote Desktop Services”

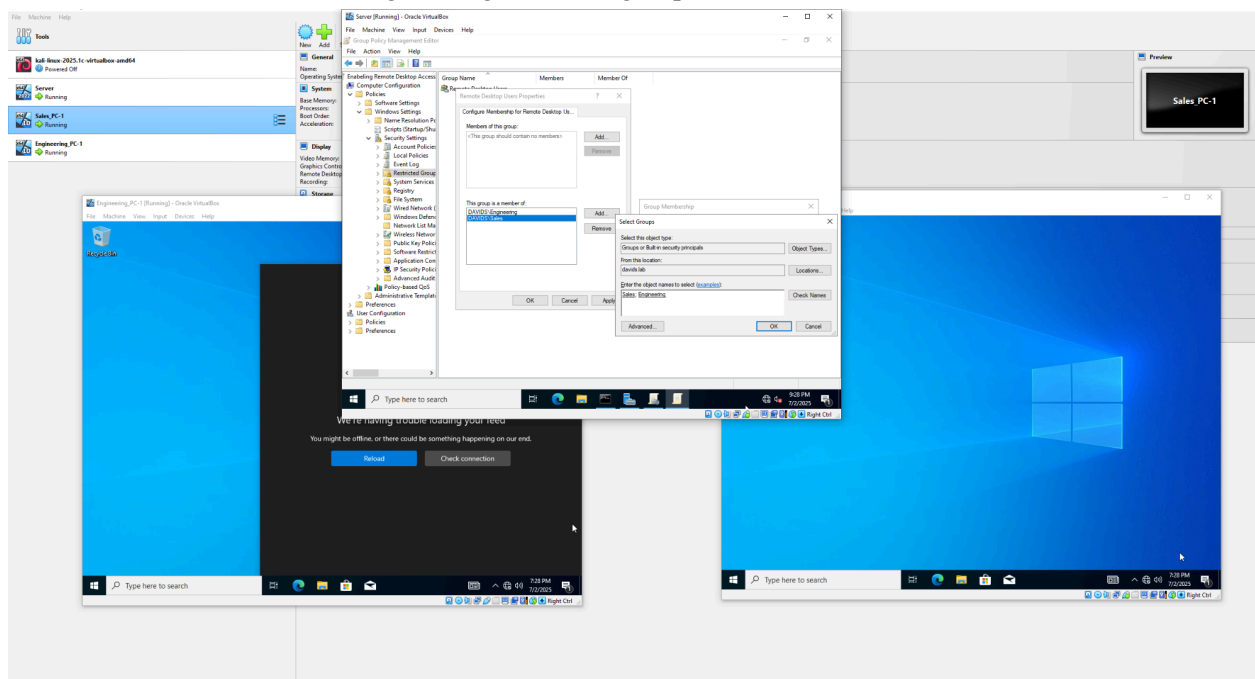

6. I also enabled “Require user to authenticate for remote connections by using Network Level Authentication”

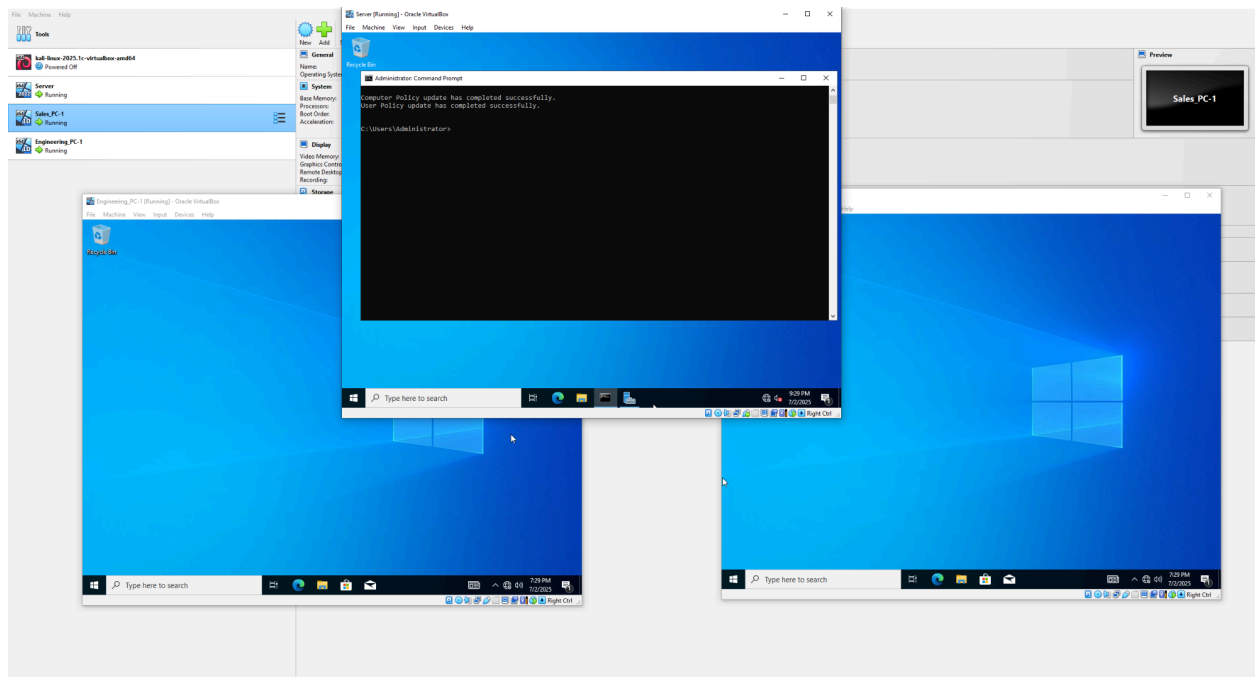

7. In the same GPO, I edited “Restricted Groups” and used “Remote Desktop Users” as the base

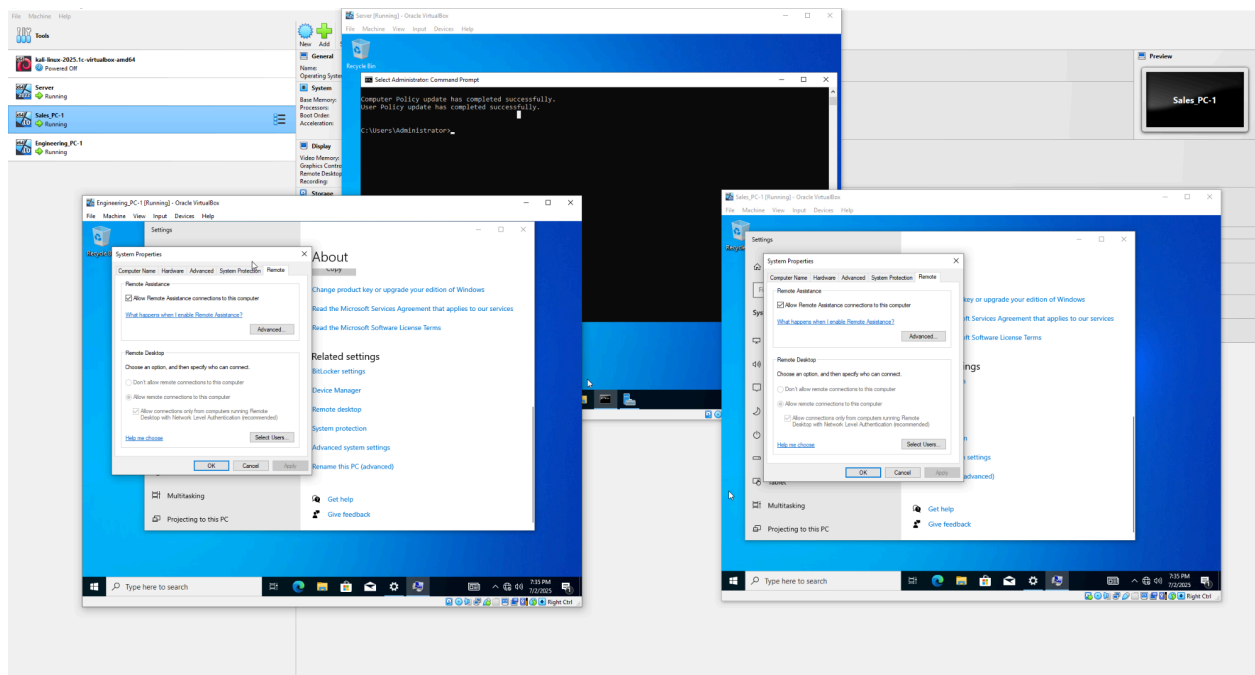

8. I added “Sales” and “Engineering” as “This group is a member of”

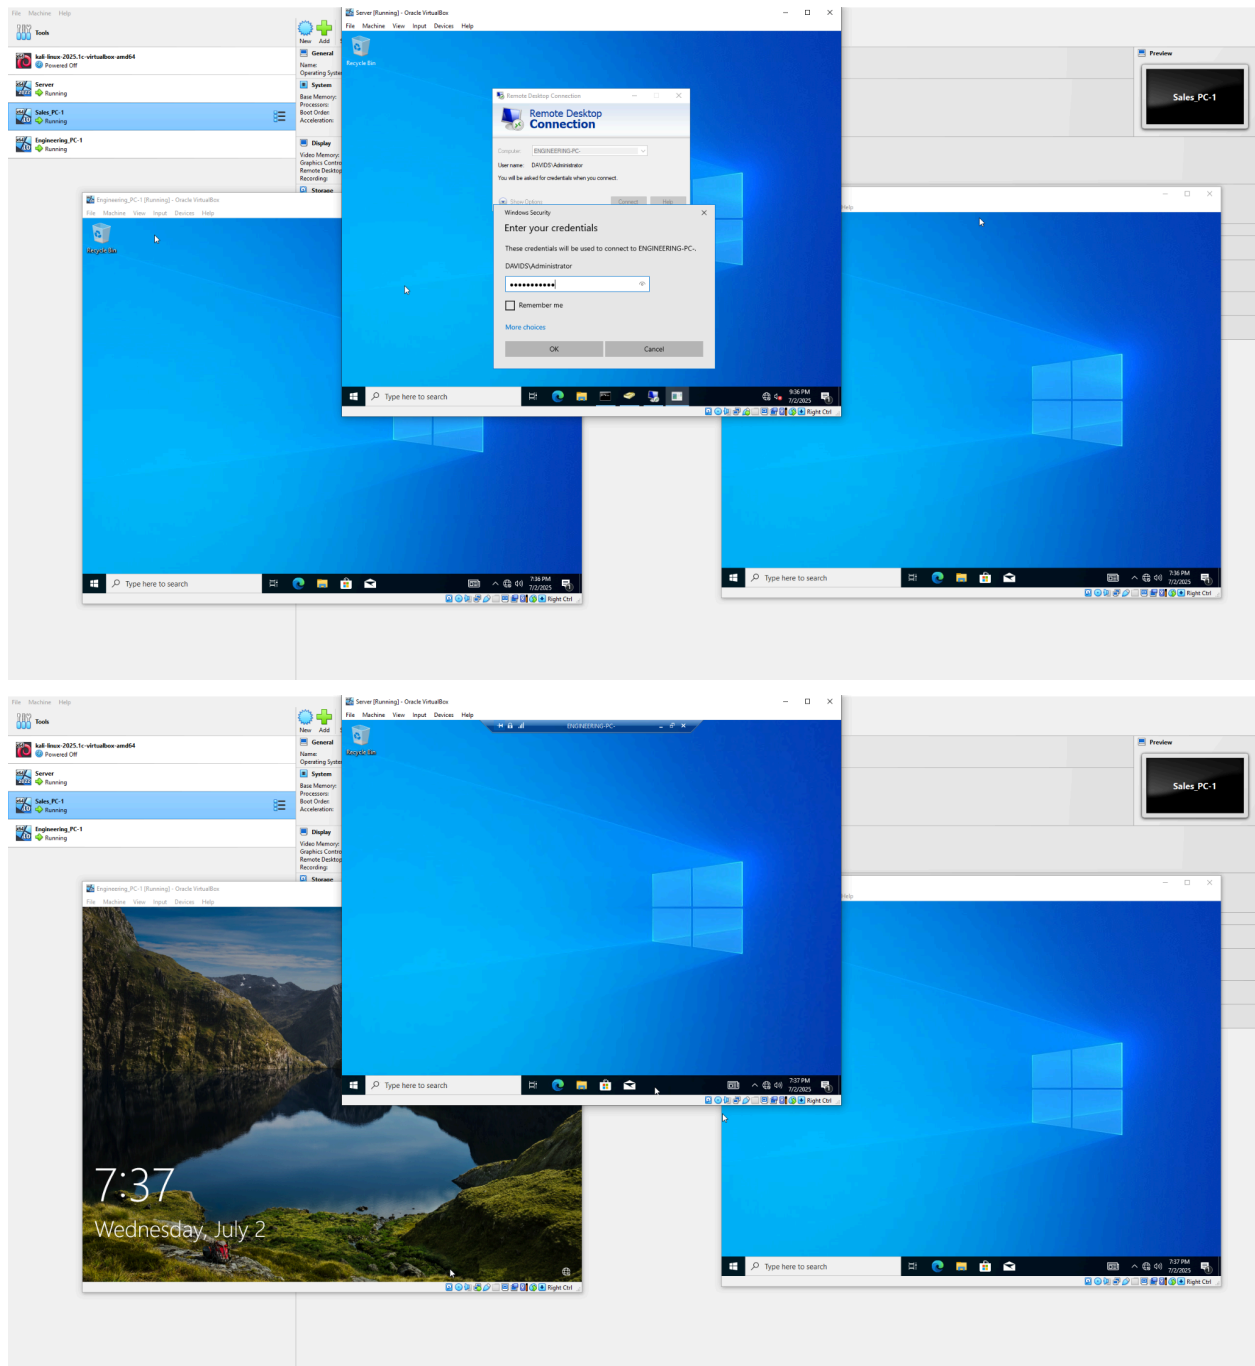

9. I forced a group policy update

10. Ensure that the Domain-joined PCs have the settings configured

11. Connect to the Engineering PC as a admin

12. Connect to the Sales PC
